The rational use and protection of water resources is important for Georgia. Not to be water in nature, life would not have been. Human life is closely related to water. The presence of abundant atmospheric sediments in Georgia, the presence of glacier and heavy snow in the highland zone leads to the melting of the rivers of our country, a large number of lakes and ponds contributing to the regulation of the river waters. The proximity to the Black and Caspian seas of high watershed rides gives the rivers a great fall and inclination, which creates favorable conditions for hydropower.

The paper deals with the natural conditions of the Black Sea coastal river basins of Adjara and the flow of river Ajaristskali and its use of water for optimal distribution and management of water resources.
